(a) short-interval mean square of $G_{m,m'}$: no inflation with L
(1, 5), $L = 20$: $\max_X \rho(X, H)$
(13, 29), $L = 1508$: $\max_X \rho(X, H)$
(1, 10007), $L = 40028$: $\max_X \rho(X, H)$
(101, 103), $L = 41612$: $\max_X \rho(X, H)$
$1 + L/H$ (what a term L would allow)
$\max_X \rho(X, H)$, $X \in [2^{19}, 2^{20}]$
window length H
(b) spectral diagonal and total, $G_{1,29}$ (level 116), $H = 256$
$S_{\text{off}}/S_{\text{diag}}$: mean +0.005, rms 0.058, range [-0.15, +0.18]
$S_{\text{total}}(X, H)$
$S_{\text{diag}}(X, H)$
window sum / mean diagonal
window start X
